13th Workshop on Antarctic Meteorology and Climate

16-18 July 2018

https://youtu.be/723763A24Fw <u>ARM West Antarctic Radiation</u> <u>Experiment (AWARE)</u>

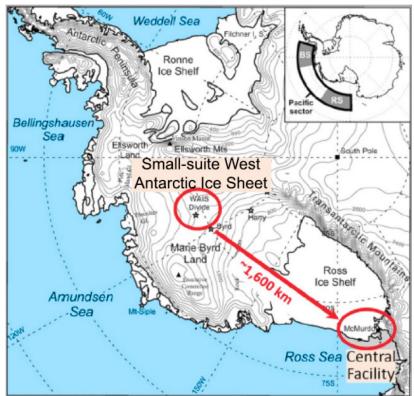

OBSERVATIONS: 23 NOVEMBER 2015 - 5 JANUARY 2017

Observations at West Antarctic Divide (WAIS) and McMurdo

West Antarctic warming during January 2016

AWARE aims to gain insight into the factors behind recent climate change in West Antarctica by quantifying the role of changing air masses on the surface energy balance. The field campaign use some of the most advanced atmospheric research instrumentation to conduct cloud, radiative, and aerosol observations.

Important for AWARE and WRF

Does our knowledge of Arctic clouds carry over to high southern latitudes?

Polar cloud observations (and modeling studies) much more extensive in Arctic than Antarctic

Antarctica is colder, has less vapor and is more pristine than the Arctic

AWARE McMurdo observations suggest Antarctic clouds are less extensive than over the Arctic Ocean, however McMurdo shows topographicallyforced vertical motions

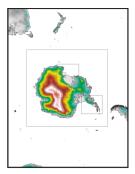

Cloud water at very low atmospheric temperature

Vertical cloud distribution is different

NCAR

The Antarctic Mesoscale Prediction System (AMPS)

- Adapted numerical weather prediction system for Antarctica
 - Polar WRF (Weather Research and Forecasting Model)
 - Variable resolution now to 0.9 km
- Priority Mission: U.S. Antarctic Program (USAP) Weather Support (clouds important for aircraft!)
- Collaborators: NCAR and OSU BPCRC

- Powers et al. (2012) A decade of Antarctic science through AMPS. BAMS, 93, 1699-1712.

13th Workshop on Antarctic Meteorology and Climate

AMPS GRIDS

NCAR January 2016 melting event 2 **Use AMPS** grid 2 for WAIS evaluation 10 km 30 km

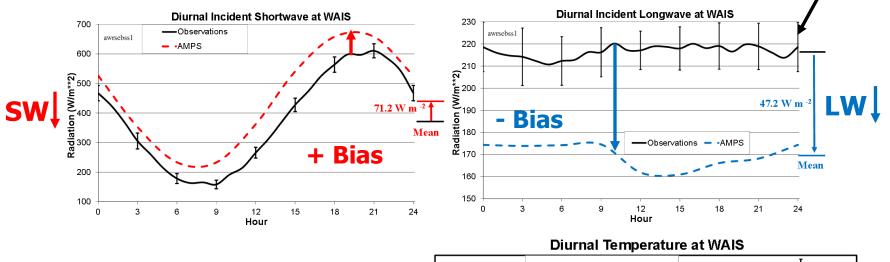

Use December 2015 and January 2016 AMPS forecasts and WAIS observations

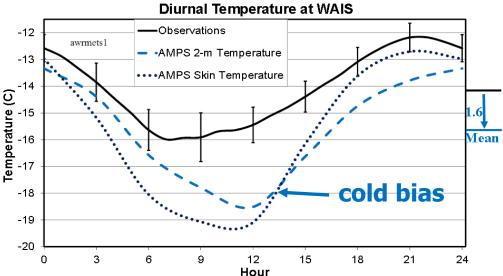

13th Workshop on Antarctic Meteorology and Climate

Test West Antarctic Summer Results for AMPS with WAIS Observations

Surface Energy Balance: Excess shortwave and deficit in longwave → Cloud deficit? T-test

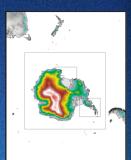

AMPS shows biases suggesting a better Antarctic cloud simulation is needed

16-18 July 2018

Test WRF Microphysics Schemes vs. AWARE WAIS Observations

PWRF 3.9.1 on AMPS Grid 2 (10 km) with ERA-I I.C. + B.C. (AMPS uses GFS)

WRF Single-Moment 5-Class (same as AMPS)

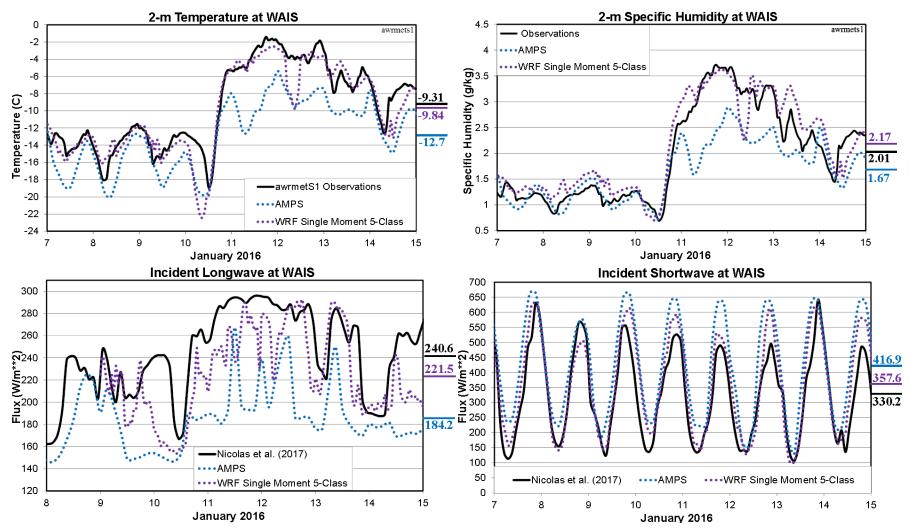

Morrison 2-Moment (slight polar modifications)

Thompson-Eidhammer Aerosol Aware

Morrison-Milbrandt P3 (avoids arbitrary cloud and precipitation categorization)

Note: New daily PWRF 3.9.1 runs use 12-35 hr output Two-times daily AMPS output with 12-21 hr fields

Near Surface Fields at WAIS 7 – 15 January 2016

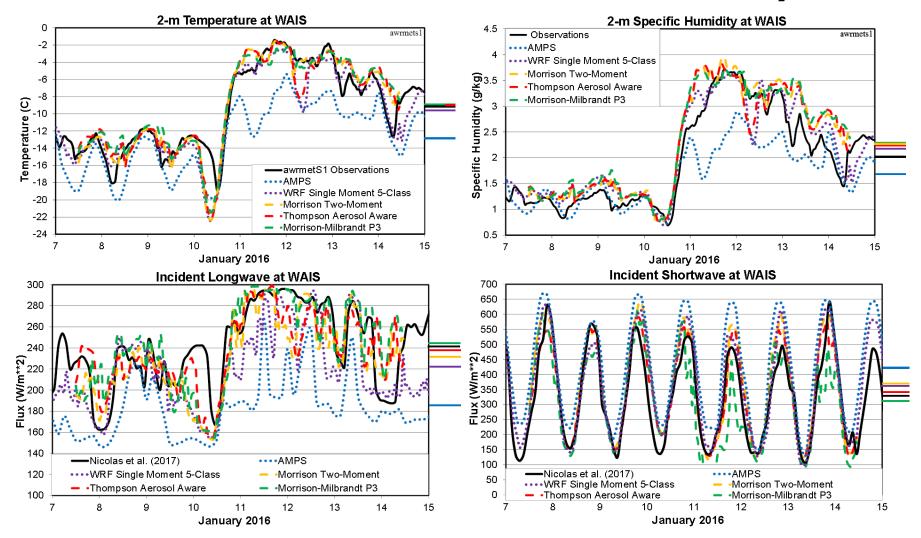

PWRF 3.9.1: SW and LW biases remain with ERA-I I.C. & B.C., but are reduced in magnitude. Temperature and humidity biases are largely removed. Can use PWRF 3.9.1 to explore Antarctic cloud biases.

13th Workshop on Antarctic Meteorology and Climate

16-18 July 2018

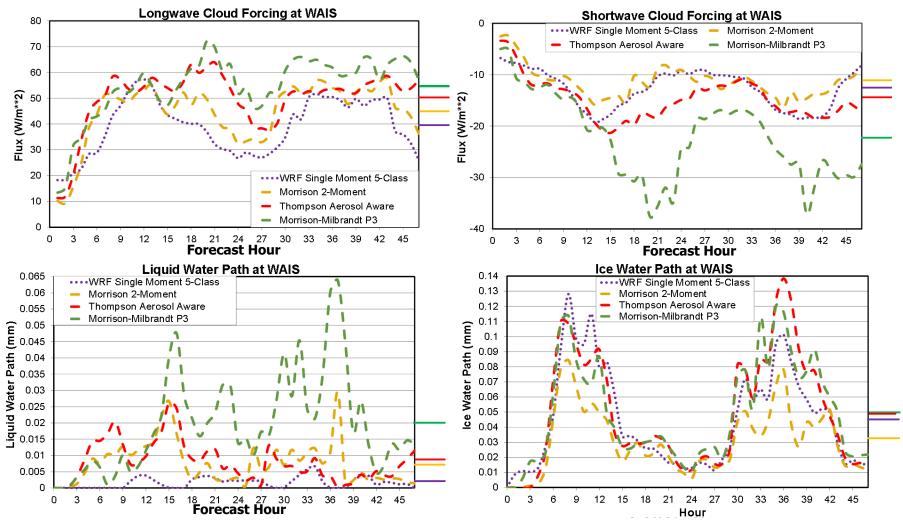

Near Surface Fields at WAIS 7 – 15 January 2016

Run with more advanced microphysics schemes: Warm bias in 2-m T? Schemes increase LW and reduce SW radiation – positive result!

13th Workshop on Antarctic Meteorology and Climate 16-18 July 2018

Average PWRF 3.9.1 Forecasts Cloud Forcing at WAIS 7 – 15 January2016

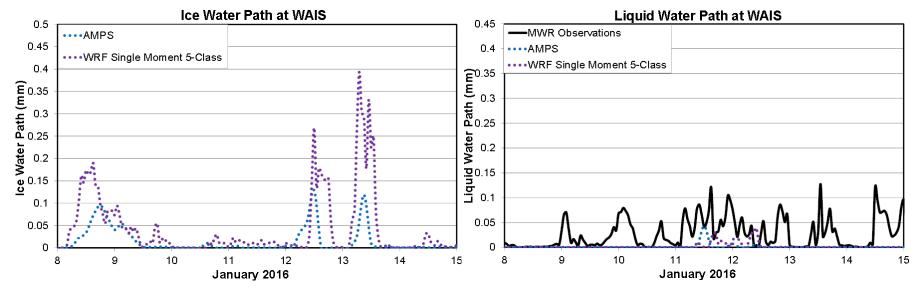

WSM5C has smallest LWP and slow spin-up of longwave cloud forcing. M-M P3 scheme has largest LWP and stronger SWCF. Microphysics schemes impact cloud radiative effects for Antarctica!

13th Workshop on Antarctic Meteorology and Climate

16-18 July 2018

Cloud Condensate Path at WAIS 8 – 15 January 2016 AMPS and PWRF 3.9.1 with WRF Single-Moment 5-Class (WSM5C)

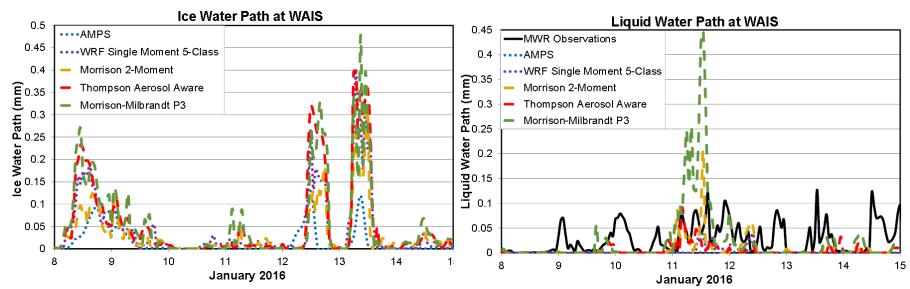

AMPS and PWRF 3.9.1 with WSM5C microphysics show much more ice water path than liquid water path.

Simulated LWP is much less than values measured by the microwave radiometer (MWR).

Liquid has greater impact on radiation than ice.

Antarctic observations show liquid at very low air temperature.

Cloud Condensate Path at WAIS 8 – 15 January 2016

More advanced microphysics schemes increase ice water path and greatly increase liquid water path.

Morrison-Milbrandt P3 scheme shows a spike in liquid water on 11 January.

Day-to-day match of simulated and observed LWP is poor.

Simulating cloud water on cold days needs research.

Summary of AMPS and PWRF Findings with the AWARE Project

- Liquid water deficit in AMPS clouds
- Cloud radiative effect of AMPS clouds is too small
- More advanced microphysics schemes increase the simulated liquid water and increase the cloud radiative effect
- Which microphysics scheme is best? not certain yet

Need to work on simulating cloud water at colder temperatures.

Clouds are critical for improving AMPS
